Experiment 5

Student Name: Aashish Pant   **UID: 22BCS12862**
Branch: CSE   **Section: IOT-642 -B**
Semester: 6th   **DOP: 28/2/025**
Subject: Java   **Subject Code:22CSH-359**

Problem - 5.1

Aim: Writing a Java program to calculate the sum of a list of integers using autoboxing and unboxing, along with methods to parse strings into their respective wrapper classes (e.g., Integer.parseInt()).
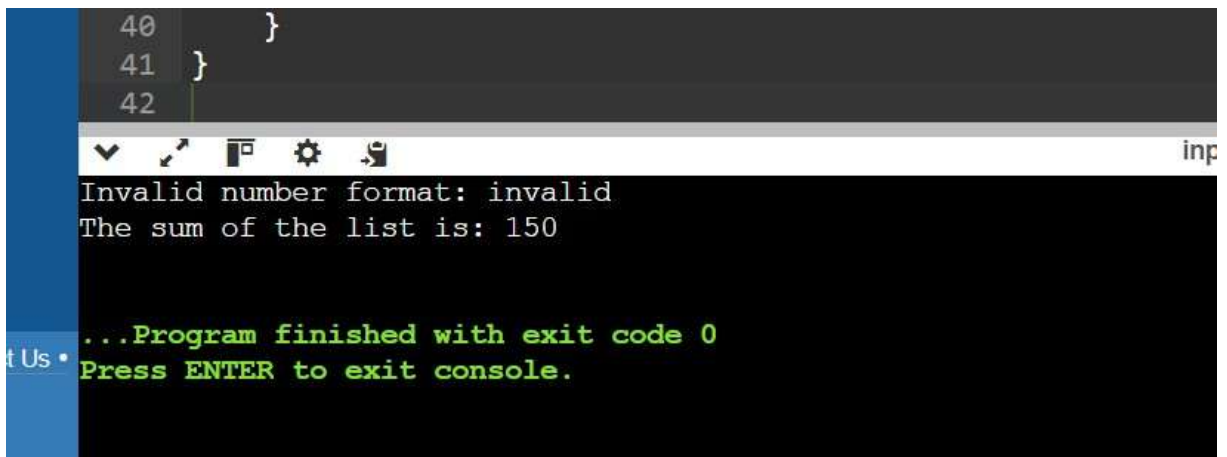

Code:

```java
import java.util.ArrayList; import
java.util.List;

public class SumCalculator
{
   public static Integer parseStringToInteger(String str)
   {
try {
        return Integer.parseInt(str);
      } catch (NumberFormatException e)
      {
        System.out.println("Invalid number format: " + str);
return null;
      }
   }
   public static int calculateSum(List<Integer> numbers)
   {
      int sum = 0;
      for (Integer num : numbers)
      {
         if (num != null) sum += num;
      }
      return sum;
   }
   public static void main(String[] args)
   {
      List<Integer> numbers = new ArrayList<>();
```

```
        numbers.add(10);
        numbers.add(20);
numbers.add(30);
        String[] inputStrings = {"40", "50", "invalid"};
    for (String str : inputStrings)
        {
            Integer num = parseStringToInteger(str);
    if (num != null) numbers.add(num);
        }

        System.out.println("The sum of the list is: " + calculateSum(numbers));
    }
}
```

Output:

Test Cases:

Test Case 1:

Input: 10, 20, 30, "40", "50"

Expected Output: The sum of the list is: 150

Description: The list contains a mix of primitive integers and integers parsed from strings.

Test Case 2:

Input: "100", "200", "300"

Expected Output: The sum of the list is: 600

Description: All values are parsed from strings, and the sum is calculated.

Test Case 3:
Input: "50", "invalid", "70" Expected
Output:
Invalid number format: invalid The
sum of the list is: 120
Description: One of the inputs is not a valid integer, so it's skipped, and the sum of valid values is calculated.

Problem - 5.2

Aim : Java program that serializes and deserializes a Student object. It saves the Student object to a file and then reads it back, displaying the student details.

The program handles exceptions like FileNotFoundException, IOException, and ClassNotFoundException.

Code :

```java
import java.io.*;

class Student implements Serializable {     private
static final long serialVersionUID = 1L;     private
int id;     private String name;     private double
gpa:
  public Student(int id, String name, double gpa) {
    this.id = id;
   this.name = name;
    this.gpa = gpa;

     }     public int
getId() {
    return id;

  }

    public String getName() {
       return name;
```

```java
    }

    public double getGpa() {
        return gpa;
    }

    @Override
    public String toString() {
        return "Student ID: " + id + ", Name: " + name + ", GPA: " + gpa;
    }
}

public class StudentSerializationDemo {

    public static void serializeStudent(Student student, String filename) {
        try (ObjectOutputStream oos = new ObjectOutputStream(new FileOutputStream(filename))) {
oos.writeObject(student);
            System.out.println("Student object has been serialized and saved to file.");
        } catch (FileNotFoundException e) {
            System.out.println("Error: File not found.");
        } catch (IOException e) {
            System.out.println("Error: IO Exception occurred.");
        }
    }

    public static Student deserializeStudent(String filename) {
        try (ObjectInputStream ois = new ObjectInputStream(new FileInputStream(filename))) {
            Student student = (Student) ois.readObject();
            System.out.println("Student object has been deserialized.");
return student;
        } catch (FileNotFoundException e) {
            System.out.println("Error: File not found.");
        } catch (IOException e) {
            System.out.println("Error: IO Exception occurred.");
        } catch (ClassNotFoundException e) {
            System.out.println("Error: Class not found.");
        }
        return null;
    }

    public static void main(String[] args) {
        Student student = new Student(1, "John Doe", 3.75);
        String filename = "student.ser";

        serializeStudent(student, filename);
```
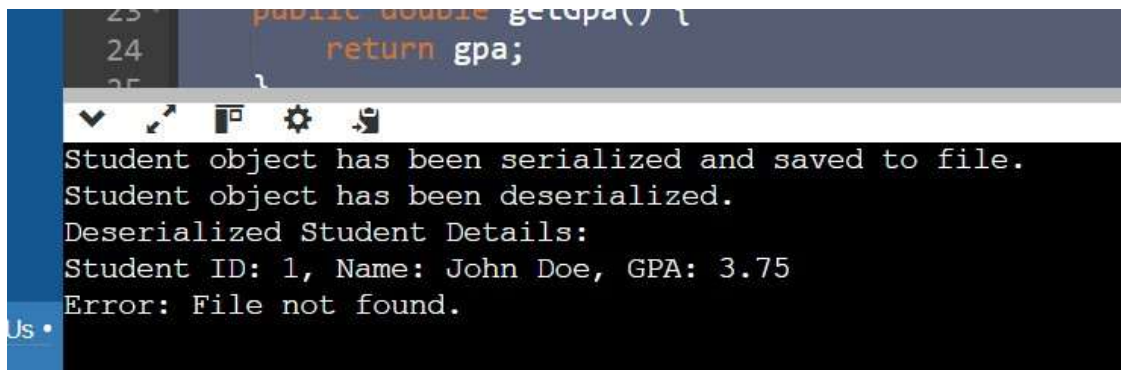

```
        Student deserializedStudent = deserializeStudent(filename);
if (deserializedStudent != null) {
System.out.println("Deserialized Student Details:");
        System.out.println(deserializedStudent);
    }

    deserializeStudent("non_existent_file.ser");

    }
}
```

Output :

Test Cases:

Test Case 1: Serialize and Deserialize a valid student object.

Input: Student(1, "John Doe", 3.75) Expected
Output:
Student object has been serialized and saved to file.
Student object has been deserialized.
Deserialized Student Details:
Student ID: 1, Name: John Doe, GPA: 3.75

Test Case 2: Try to deserialize from a non-existent file.
Expected Output:
Error: File not found.

Test Case 3: Handle invalid class during deserialization.
Input: Manually modify the class file to simulate a ClassNotFoundException.

Expected Output:
Error: Class not found.
